Eigenvector Analysis

Dashboard → Analytics → Eigenvector Weights

📊 Principal Eigenvector Weights

T (Tasks)
Recognition edges

0.54

D (Diversity)
Tag variety

0.28

U (Unique)
Teammates reached

0.18

💡 What This Means

The principal eigenvector shows that **recognition frequency (T)** has the highest weight in your team's KQ calculation, followed by tag diversity and unique connections. This reflects your team's culture of frequent, focused appreciation.

1.52	0.10	87%
Λ_1 (EIGENVALUE)	SHRINKAGE A	VARIANCE EXPLAINED

🔢 Correlation K-Matrix

Shrinkage-adjusted correlation matrix: $K = (1-\alpha)R + \alpha I$

	Z_T	Z_D	Z_U
Z_T	1.00	0.32	0.28
Z_D	0.32	1.00	0.22
Z_U	0.28	0.22	1.00

$$s_i = w \cdot \log(T, D, U)$$

Base score calculation using eigenvector weights

🧮 Robust Statistics Applied

Features are transformed via `log1p`, centered with `median`, scaled by `MAD`, and winsorized at p2/p98 before correlation. Shrinkage (α=0.1) stabilizes estimates for small samples.
